

## Technology

In Technology, students have been exploring how different cams create movement as part of our automata unit. They have tested a range of cam shapes and observed how each one changes the type of movement produced. This learning will eventually be used to create their own automata bees.

Students are now moving into the design stage, developing prototypes and experimenting with their own ideas. This week, they will test their designs, identify what works and what needs improving, and refine their ideas before moving towards their final creations.
